The Myositis Association
Exercise for all

Helene Alexanderson
Ass Professor, PhD, RPT
Karolinska Institutet / Karolinska University Hospital
Stockholm Sweden
This program can improve

- Muscle strength
- Ability to stand up from sitting
- Walking ability
Results: muscle strength

Mean percentage change in patients (n = 7) muscle strength following the exercise intervention when compared to pre-intervention strength levels normalized to 100%.

*P > 0.05

Take home message

- Exercise should be designed individually and adapted to muscle weakness, pain or fatigue with regular follow-up

- After completing the 16-week home exercise, change into another program at home or in a training facility. When you are ready, start another 16-week home exercise period.
  - Gym exercises / aquatic training / senior classes / balance-core training etc.
  - Frequent training seems to be important in IBM - doing something most days of the week

- If you have experienced increased muscle pain or muscle weakness after moderate-intensity exercise or physical activity before - initiate the program on lower loads and repetitions and follow-up often

- The program is most often well-tolerated, but clinical experience indicate that the program could lead to more symptoms in rare cases
A home exercise program if you:

- ...recently was diagnosed with PM or DM
- ...go into a flare in PM or DM
- ...if you haven't exercised for a long time or never before
Home exercise program

- Improved muscle function and health (Physical, Pain, Fatigue) without increased muscle Inflammation
- Signs of reduced inflammation in patients with low disease activity

1. Warm-up
2. Shoulder mobility
3. Grip strength
4. Strength knee extensors
5. Strength shoulders
6. Strength hip extensors
7. Strength neck flexors and trunk
8. Strength hip flexors

08/09/2019

Helene Alexanderson
How to use the home exercise program?

PM/DM/NM/ASS

- Get started with a physical therapist if possible.
- Start with about 10 repetitions of each exercise. Your perceived exertion should initially not exceed 3-4 (Borg CR-10 scale), 0-10. If needed, add extra weights using weight cuffs or rubber bands. With improved muscle function and lower disease activity you should exercise on an intensity corresponding to 5-7.
- Short exercise sessions of 15-20 minutes with additional 20-minute walks five days a week during first 12 weeks
- Be sure to change between exercising upper- and lower limbs (For example: don’t do all upper limb tasks in a row, but rather perform according to the sequence on the previous slide.

To rate your perceived exertion after an exercise session, just register the number that you feel best represents your experience. Lower number correspond to lower exertion, while higher number describes a higher level of exertion. The anchor words are there to help, and you can always use numbers without an anchor word. For example: a 6 corresponds to an experience of exertion that is stronger than a 5, but not exerting enough to be described as a 7.
When to start - all people with myositis

- Recent diagnosis: After about 4 weeks following introduction of corticosteroid treatment. You and your rheumatologist should note some clinical signs of improvement before starting.

- Be sure to assess muscle function and aerobic capacity before starting and then follow-up after about three months. With improvement, progress intensity or try other types of exercise, such as
  - Aquatic training
  - Gym exercises
  - Nordic walking or biking
  - Any exercise that you enjoy
Frequent walking - all people with myositis

- To improve aerobic capacity you should walk or do other aerobic physical activity at least 20-30 minutes at least 2-3 days a week on an intensity of 50-70% of your maximal heart rate.

- You can calculate your estimated maximal heart rate: 220-age and then you can calculate on which range of heart rate you need to be to improve aerobic capacity.

- Example: I am 45 years old: 220-45=175 (my estimated maximal heart rate). Then I need to calculate my range of heart rate for exercise session: 175 x 0.5 =87.5 and 175 x 0.7 = 122.5 (my heart rate range during exercise should be: 87.5 - 122.5.

- Check your heart rate manually or by using heart rate monitor
Intensive resistance training
PM/DM/NM/ASS:

- You have low disease activity, lower corticosteroid doses. Stable phase of disease

- This program is contraindicated if:
  - You have severe osteoporosis and have experienced fractures
  - If you have corticosteroid dose exceeding about 20 mg/day
  - If you have severe arthritis
Intensive resistance training in low-active adult PM and DM

- 3 sets of 10 repetitions on 10 voluntary repetition maximum (the weight you can lift 10 times but not 11, 70% of Maximal strength)

- Improves muscle strength and endurance
- Reduces disease activity and inflammation

- Deltoids
- Quadriceps
- Lat dorsi/biceps
- Gastrocnemius
- Trunk/neck

How to get started and apply resistance?

- Get started under supervision of PT if possible
- Start on lower loads allowing 20 VRM (=20 repetitions, about 50% of maximal strength)
- Always warm-up before exercising and don’t forget to stretch!
- It is normal to experience muscle soreness a couple of days after exercise (especially in the beginning or after increasing loads)
- During exercise you should not exceed perceived exertion of 7 on the Borg CR-10 scale and you should always be able to be active during the rest of the day
- Joint pain during exercise does not mean that the loads are too high, however, use lower loads if joints tend to swollen and be painful after exercise.
- As long as you feel that you get stronger and healthier, continue. If you don’t experience improvements or get weaker, contact your PT or rheumatologist.
To rate your perceived exertion after an exercise session, just register the number that you feel best represents your experience.

Lower number correspond to lower exertion, while higher number describes a higher level of exertion.

The anchor words are there to help, and you can always use numbers without an anchor word.

For example: a 6 corresponds to an experience of exertion that is stronger than a 5, but not exerting enough to be described as a 7.

0  No exertion
0.5 Extremely week (light)
1    Very light
2    Light
3    Moderate
4    Somewhat strong
5    Strong (heavy)
6
7    Very strong
8
9
10 Extremely strong (almost maximal)

• Maximal
Intensive aerobic and endurance training for PM/DM/NM/ASS

- Exercise program
- 3 times/ w, 12 weeks
- 30 min cycling (load of 70 % of VO₂ max)
- 20 min muscle endurance (30-40 % of 1VRM)
Creatine supplementation AND exercise in myositis

- Phosphocreatine (Pcr) is an important part of the muscle glycolytic (anaerob) metabolism
- Individuals with DM are reported to have low levels of Pcr
- Pcr is most important in the muscle energy system during the first seconds of exercise, but is still used to continue muscle contractions up to 2 minutes
- Five months creatine supplements combined with regular exercise (like home exercise) is more effective than exercise alone in established PM/DM.
- Talk to your rheumatologist before starting
Creatine dose - PM/DM/NM/ASS

- Introduce creatine in addition to at least 2-3 days a week exercise
  - Could be any kind of resistance training alone or combined resistance and aerobic exercise
- Loading dose of 8 grams / day for 3 days
- Continue with a maintenance dose of 3 grams / day for 3 months
- Take a 4-week break from creatine and continue to exercise
- Start again with the maintenance dose for another 3 months and continue this cycle
- Creatine supplements can ONLY have positive effects on muscle function in combination with exercise
- If you don’t exercise regularly - DON’T take creatine supplementations!
Exercise guidelines for healthy - also relevant for PM/DM/NM/ASS in low disease activity. People with IBM probably needs even more frequent exercise

Health-enhancing physical activity - to reduce risk of cardiovascular disease, diabetes, osteoporosis and some forms of cancer

150 minutes of physical activity on a moderate intensity / week
OR
75 minutes of physical activity on a high intensity / week
+ Strength training twice a week

For individuals > 65 years, balance training is also recommended
Health benefits from regular physical activity

- Strong association between aerobic capacity and health! Both in healthy and in myositis
- Regular physical activity and exercise can:
  - Improve quality of life
  - Reduce risk of type II diabetes, osteoporosis and cardiovascular disease
  - Reduce high blood pressure
- Important as individuals with inflammatory rheumatic diseases are at higher risk of developing cardio-vascular disease
Take home message

- Exercise should be designed individually and adapted to disease activity and disability with regular follow-up during active disease.

- Active progressive exercise should be recommended to patients in all stages of disease - better to do something rather than nothing.

- Exercise should be able to be incorporated in your daily life.

- Regular physical activity.
Everyday physical activities / social activities
